

**FOR IMMEDIATE RELEASE**

## **Contact Tracing App Hits Frontlines of COVID-19 Pandemic, Helps Communities Monitor Exposure Risks in Real-Time**

*“A revolutionary new application, Contact Tracing protects individuals and communities from COVID-19 by mitigating community spread and flattening the infection curve.”*

**14 April 2020, Foster City, CA** - Contact Tracing is now a new mobile application monitoring COVID-19 cases and exposure risks in real-time, is empowering individuals and communities around the world. Now available in the Apple Store and Google Play Store, Contact Tracing lets people know if they’ve come into contact with the virus and allows them to anonymously self-report if they’ve become infected to mitigate the transmission of the Coronavirus, or COVID-19.

A free application, Contact Tracing helps people get useful, specific information on their real-time risk of exposure. Leveraging the power of modern GPS and Bluetooth technologies, Contact Tracing privately monitors a user’s real-time location and cross-checks their travel history with that of other application users. If two or more users cross paths with someone who has reported positive for COVID-19, Contact Tracing immediately notifies all users, anonymously, who were near that person’s location. Empowering real-time monitoring and tracking of COVID-19 cases, Contact Tracing uses the power of herd protection to safeguard communities. With each registration, society at large grows safer.

“We created this application to support our frontline workers and first responders who are putting themselves out there every day,” remarked Alexander Desuasido, a developer behind Contact Tracing. “After shelter-in-place orders swept the nation, Contact Tracing will help society ease back into normalcy by avoiding a dangerous resurgence in cases from community spread.”

Designed for individuals and communities, Contact Tracing can also be used by medical facilities, who can provide validated test results to the application via QR Codes with a patient’s consent.

Available today, download Contact Tracing for free from the [iOS App Store](#) or [Google Play Store](#). Owing it to ourselves and our communities, do your part to mitigate the spread of COVID-19 today. To learn more, please visit [ContactTracing.mobi](#).
